

On average, solar panels produce on their own between 4 to 13 amps, depending on the power and voltage rating of the panel. This study is based on 100-watt up to 500-watt panels. However, what does this even mean? Does my 400w panel produce like an "actual" 10 amps to power my refrigerator, laptop, AC conditioner, and some other appliances?

The use of reflectors can be a promising solution to increase the intensity of solar radiation received by PV panels. It is known that the output power of a PV panel is proportional to the amount of solar radiation that a PV panel receives.

The main factor that affects photovoltaic (PV) panels is that PV panels cannot optimize the intensity of existing solar radiation so that only a small amount of solar radiation is absorbed .

It is known that the output power of a PV panel is proportional to the amount of solar radiation that a PV panel receives. The addition of reflectors to PV panels will increase the distribution of solar radiation so that the output power and efficiency of PV panels will increase.

One of the methods needed to improve the performance of PV panels is the concentrated solar radiation method [5,6]. This method uses technologies such as proven reflectors to improve the performance of PV panels. A reflector is a simple method that can transmit solar radiation to PV panels.

The results showed that the addition of reflectors to PV panels can increase the distribution of solar radiation received, thereby increasing short-circuit currents that have an impact on the output power and efficiency of PV panels.
